## 1 FORTRAN

### 1.1 CONSULTING LOG

Expected hours needed: 10

<i>Date</i>	<i>Hours Spent</i>	<i>Tasks / Accomplishments / Issues / Thoughts</i>
03/02/2021	3	I began to get some of the basics down here and actually got rid of some errors that would not let me print. I think the hardest part is reading these ambiguous and long error messages.
03/08/2021	3	Made some progress with functions. It's still giving me trouble but I switched over to a different web based IDE that has some better error messaging because I found ideone.com to be confusing in error messaging with too much on the screen.
03/22/2021	1	I messed around with some things and got frustrated so I moved to start COBOL in order to not waste time dwelling on Fortran.
03/23/2021	2	I finally got the syntax down for what I was doing wrong in the function sections with some new found understanding for what was going on and what some key-words meant. Once the encrypt function was working, decrypt fell into place and then solve came shortly after. The most frustrating thing at the very end was why there were extraneous spaces in the middle of the "Caesar 25-0: ..." part in solve. I could not figure out how to reformat it, but it works and that's what matters.

### 1.2 COMMENTARY

Fortran was very frustrating for me mainly because of the syntax. I found it confusing and not a whole lot of useful documentation that worked in this version. The coding ground website was also more helpful but only for fortran because the error messages were easier to follow, but still confusing compared to something like C or Java. Overall it was not terrible, but not enjoyable.

## 1.3 SOURCE CODE

```

## 2 COBOL

### 2.1 CONSULTING LOG

Expected hours needed: 12

<i>Date</i>	<i>Hours Spent</i>	<i>Tasks / Accomplishments / Issues / Thoughts</i>
03/22/2021	4	Spent a lot of time looking over the basic syntax and learning the program structures with the different areas of the overall program.
03/23/2021	2	I learned a good amount about the tables and how they work. They are still a bit weird and I mostly understand it, but it makes less sense to me in this context and more sense in the other examples I've seen like being able to hold costumer data.
03/25/2021	4	I made some good progress and went step by step more than I have been with any of the other languages, seeing what worked and what didn't. It made things easier and seemingly take less time. I made good progress on the encrypt subprogram and now it's just time to debug it and make it better. I am still struggling on how to trim the strings down with the trailing spaces. Nothing is seeming to work in this version that I found. I also finished the decrypt function, got out the bugs and the solve function is done, but buggy.
03/26/2021	1	I got a lot more done yesterday than I thought I would. I am still having trouble with the solve function because it is only printing out the first 2 letters for each shift on every single string. The letters are correct in the shift, but most of the updated string is lost in the ether and I don't know why.

### 2.2 COMMENTARY

I found COBOL to actually be slightly more tolerable than Fortran in some ways. Although this felt nothing like any of the other programming languages, I think that actually helped in some ways, because I did not get as hung up on trying to write it like the other languages. At the same time, the syntax is even more confusing than Fortran's in a lot of ways and parts of it I did not understand. I think it would not have been that bad, but the IF statements and PERFORM keyword did not work the same in the version on ideone.com as the resources I saw. This version that they had there was more frustrating to work with in many ways that would not have happened if it was a different version of COBOL. There did not seem to be else if statements or else statements. Unless I was just writing them wrong, they did not work in any of the ways I had tried. Perform also did not work for me outside of paragraphs.

## 3 BASIC

### 3.1 CONSULTING LOG

Expected hours needed: 6

<i>Date</i>	<i>Hours Spent</i>	<i>Tasks / Accomplishments / Issues / Thoughts</i>
03/19/2021	1	Spent some time learning the syntax, and setting up the base of the code. Also started the encrypt but did not finish it yet.
03/20/2021	2	I really did not have much debugging to do with Visual Basic. It worked exactly how I thought I would and things just felt intuitive and natural. There was also a good amount of resources online to be able to figure out syntax and helpful functions.

### 3.2 COMMENTARY

I personally liked Visual Basic the best, not only because it took me the least amount of time to complete, but because it felt intuitive as I was writing it. It translated really well in my head when I was writing it although I am not sure if that is just because I already wrote the code 2 other times and spent a lot more time debugging the other ones. Also I think what made it the most enjoyable was the amount of documentation online for this version. All the documentation was really helpful and easy to follow. I would definitely base my own language off of some of the syntax and functions in this language.

### 3.3 SOURCE CODE

```

1 Imports System
2 Module Test
3     Function encrypt(testStr as string, shift as integer) as string
4         DIM encryptedStr as string
5         DIM e as integer
6
7         for e = 0 to len(testStr)-1
8             DIM letter as char = testStr(e)
9             if((Asc(letter) >= 65) and (Asc(letter) <= 90)) then
10                 if((Asc(letter) = 65) and (shift < 0)) then
11                     encryptedStr += Chr(Asc(letter) + 26 + shift)
12                 else if((Asc(letter) = 90) and (shift > 0)) then
13                     encryptedStr += Chr(Asc(letter) - 26 + shift)

## 4 PASCAL

### 4.1 CONSULTING LOG

Expected hours needed: 8

<i>Date</i>	<i>Hours Spent</i>	<i>Tasks / Accomplishments / Issues / Thoughts</i>
03/15/2021	1	Learned syntax and started it based off of what I had done for Scala.
03/17/2021	3	I wrote out the encrypt function, however I am getting some weird errors that I can't discern. I finally got some of them to go away when I added parenthesis and found out how to properly type cast some variables.
03/18/2021	3	Spent a lot of time debugging the encrypt function and finally got it to work. It is still buggy though. I also wrote some of the decrypt function based off of the encrypt, however, both are buggy with certain letters not moving in the right direction. This is because the if statements are not working how I would like them to. "else if" and "else" syntax are giving me a really hard time.
03/19/2021	2.5	After a couple of hours of trying to figure it out, I finally figured out the BEGIN and END for the nested if statements that contained else and else if's with help from your email. The syntax of it was what threw me for a loop and I could not wrap my head around it for a while.

### 4.2 COMMENTARY

Pascal was not at all bad to work with and it had some great concept things in the context and in functions. However, I thought some of the syntax was confusing especially with If, else if, and else statements. Everything else was fine, but ending these statements was confusing and did not work how I thought they did or should

have. The documentation for this online mainly was not helpful until I emailed you which cleared up how to group/end the statements.

### 4.3 SOURCE CODE

```

1 program ideone;

## 5 SCALA

### 5.1 CONSULTING LOG

Expected hours needed: 6

<i>Date</i>	<i>Hours Spent</i>	<i>Tasks / Accomplishments / Issues / Thoughts</i>
03/10/2021	0.5	Time mostly spent learning the basics and learning the syntax.
03/11/2021	1	I mostly just spent a lot of time debugging.
03/12/2021	1	a lot more debugging with some more research and learning. My biggest issue between yesterday and today has just been with replacing the characters in the character array with a new value. So far I have only been able to get spaces to print out rather than what I actually thought it would. Mostly syntax errors but some conceptually errors on what is going on.
03/14	3	I FIGURED IT OUT. I did not work on it for terribly long before I finally got it to work today. Once I got the encryption done, decryption took significantly less time and the solve function took even less time with some room for me to make it look a little nicer. Getting that syntax and getting myself to write code that will do what I know I conceptually need to do was a big relief for me and it made my "late" night all worth it. I also ended up switching back to ideone.com because codingground was not working/ connecting to their servers.

## 5.2 COMMENTARY

Scala felt very close to Java and other languages that I'm more used to, which I know was kind of the point. That made it easier for me to get that baseline of code down and figure out the logistics of writing the program without as many syntactical hiccups. This did not take me too long to write, or at least not as many headaches like Fortran and COBOL. Scala was enjoyable and I can see myself taking ideas from it and using it again in the future.

## 5.3 SOURCE CODE

```
